

## Tutorial for Program Verification

### Exercise Sheet 12

In this exercise sheet we work with the theory of arrays, and arrays in Boogie.  
Submit your solution by uploading it as PDF in ILIAS. Upload SMT scripts as text files.

#### Exercise 1: Sortedness

1 Point

On Exercise Sheet 4 we used an 1-ary function symbol  $ar$  to represent an array. Your task was to find the formula

$$\forall i, j. i \leq j \rightarrow ar(i) \leq ar(j)$$

which states that the array is sorted in ascending order. If we assume that domain and values of the array are integers and we use the theory of arrays and SMT-LIB syntax the formula is written as follows.

```
(forall ((i Int) (j Int)) (=> (<= i j) (<= (select ar i) (select ar j))))
```

- Give analogously an SMT-LIB formula `fsort` that states that the array  $ar$  is sorted between two integer indices  $lo$  and  $hi$  (inclusive).
- Give additionally an SMT-LIB formula that you can use to test your result. E.g., state a formula `fctest` such that the result for the `check-sat` command in the following SMT script is `unsat` but becomes `sat` if the line with `fsort` is deleted.

```
(set-logic ALIA)
(declare-fun ar () (Array Int Int))
(declare-fun lo () Int)
(declare-fun hi () Int)
(assert fsort)
(assert fctest)
(check-sat)
```

You can use the web interface of the Z3 SMT solver <sup>1</sup> to check your SMT script.

## Exercise 2: Sorting Algorithm

2 Points

Implement the Bubble Sort algorithm<sup>2</sup> in Boogie<sup>3</sup>.

- Your procedure should have the signature `sort(lo : int, hi : int, a : [int]int)` returns `(ar : [int]int)`.
- The values of the resulting array `ar` between the indices `lo` and `hi` (inclusive) should be sorted in ascending order.
- Each value that occurs  $n$  times in `a` between indices `lo` and `hi` should occur  $n$  times in `ar` between indices `lo` and `hi`.

You can use the Boogie interpreter Boogaloo<sup>4</sup> to test your program.
